

Case Study 01: A/B Testing Variation

High-Velocity Creative Optimization with AI

01. The Challenge: Overcoming Creative Fatigue in Ad Agencies

In the fast-paced world of Meta advertising, ad creatives lose their effectiveness rapidly, leading to "creative fatigue" and plummeting ROI. Agencies often find themselves in a bottleneck: traditional design cycles take days to produce new variations, and at \$30-\$50 per static ad, extensive A/B testing becomes a massive financial burden. Most existing AI tools only add to the frustration by generating off-brand content that requires more time to fix than to create from scratch.

02. The Solution: Scaling Performance through Intelligent Augmentation

Our platform shifts the focus from "replacement" to "augmentation." By taking a client's winning creative and generating subtle, data-backed variations, we maintain strict brand integrity while enabling rapid-fire A/B testing. Powered by Google API (Nano Banana) and specialized AI agents, the system delivers high-performing variations in seconds, allowing agencies to stay ahead of the algorithm without increasing their design overhead.

03. Strategic Impact: Data-Driven Performance

Research indicates that 1 in 7 A/B tests fail simply due to poor variable isolation or lack of diversity. Our solution addresses this by ensuring every variation is strategically different yet brand-consistent, keeping Meta’s 7-14 day learning phase constantly fueled with fresh data.

Operational Efficiency: AI vs. Manual Design

Metric	Traditional Workflow	Our AI Solution
Production Cost	\$30 - \$50 per ad	~\$0.90 per ad
Delivery Time	3 - 5 Days	< 90 Seconds
Scale Potential	~15 Ads Monthly	200+ Ads Monthly

04. Design Leadership: Transforming Code into a Product

I was tasked with turning a functional but unpolished prototype into a professional-grade SaaS tool. I led the product requirements (PRD) and established the logic for the AI's creative output. Recognizing that the initial UI lacked professional flow, I moved the project into Figma to build a comprehensive **Mini Design System**. This ensured that the complex AI backend was wrapped in a seamless, scalable interface that developers could implement with precision.

05. Core Innovations: Precision and Clarity

I focused on two critical modules to ensure the platform delivered immediate value to PPC managers.

Actionable Dashboard Overview

I redesigned the dashboard to prioritize "at-a-glance" decision-making. By implementing a high-contrast visual hierarchy and color-coded performance indicators, I enabled users to spot winning trends instantly. The addition of the **"Pulse" View** provided much-needed transparency, showing the real-time status of the AI generation pipeline.

Intelligent Variation Hub

To facilitate better creative decisions, I built a side-by-side **Split-View Layout** for comparing original ads with AI variations. Each output includes an **AI Analysis Overlay** that explains the strategic rationale behind each change—such as emotive headline shifts or CTA contrast adjustments—allowing users to edit and deploy directly to Meta with total confidence.

Case Study 02: Michael's Social Portfolio & CRM

Empowering Creators with Business-Grade Infrastructure

01. The Problem: The "Talent vs. Business" Gap

Michael, a high-end social media creator returning from New York, had world-class content but no professional way to manage his business. His work was scattered across files, and he lacked a central hub to handle the influx of leads his content generated. For a creator at his level, a simple gallery wasn't enough; he needed a professional platform that functioned as a lead-capture engine and a management suite.

02. The Solution: A Hybrid Portfolio & CRM Engine

I designed a custom, high-motion platform that serves as both Michael's stage and his office. It combines a video-first interactive portfolio with a robust back-end CRM. This hybrid approach allows him to showcase his NYC work through immersive interactions while streamlining his entire business—from lead intake to project scheduling and task management—all in one centralized environment.

03. My Process: Engineering a Creative Workflow

The project began with a deep dive into Michael's extensive NYC content library to establish a clear information hierarchy. I designed a robust admin dashboard specifically tailored to a creator's workflow, including automated calendar synchronization and lead status tracking. This ensures that Michael can focus on creating while the system handles the operational overhead of his freelance business.

04. Key Features: Designed for Growth

The platform was built to bridge the gap between creative expression and professional reliability.

Immersive Video Portfolio

The front-end utilizes **Dynamic Video Integration** and **Genre Filtering** to bring Michael's work to life. The navigation is designed to guide potential clients seamlessly from his high-impact featured projects to a detailed library of his work, ensuring a premium user experience.

Centralized Business Dashboard

The back-end hub provides Michael with a **Lead Management System** to track inquiries, an **Automated Calendar** for hassle-free scheduling, and **Project Management Tools** to organize upcoming shoots and daily tasks, turning his portfolio into a scalable business tool.

05. The Technical Edge: Vibe Coding with Claude

To push the limits of modern design delivery, I utilized **Claude Design** to translate my vision into a functional product. Through **"Vibe Coding,"** I directed the AI to implement complex interactions and pixel-perfect polish. This allowed me to act as both designer and director, ensuring the final product matched my high-fidelity vision without the traditional friction of manual development.

Case Study 03: Reasy – Real Estate Matching

Architecting Strategy for the Modern Rental Market

01. The Challenge: A Disconnected Rental Ecosystem

The rental market is notoriously fragmented, with tenants, landlords, and brokers often working at cross-purposes. Reasy was designed to centralize this journey, but when I joined mid-way, the product lacked a clear matching strategy and offered no infrastructure for the business owner to manage the platform's growing activity.

02. The Solution: Strategic Matching & Operational Control

I stepped in to lead the product beyond its visual interface. I developed a weighted matching algorithm that prioritizes key user variables to ensure high-quality connections. Simultaneously, I architected and designed a comprehensive Admin Dashboard from scratch, giving the client their first-ever tool for managing users, listings, and platform transactions in real-time.

03. My Process: Strategic Intervention

Joining an ongoing project required a fast-track assessment of product gaps. I focused on two core pillars:

Developing the Matching Formula

I analyzed user data to identify the variables—such as lifestyle, budget, and location—that most accurately predict a successful match. Working with the client, I established a weighted logic system that automates these connections, creating a more efficient and satisfying experience for all user types.

Building the Admin Infrastructure

I mapped out the entire operational lifecycle of the platform to design an Admin Dashboard that provides total visibility. This included user moderation tools, transaction monitoring, and listing management, transforming Reasy from a simple app into a manageable, scalable real estate business.

04. Key Innovations: Intelligence at Scale

The platform's success relies on its ability to make smart connections and provide professional oversight.

Smart Matching Engine

A variables-based system that automates the discovery process for tenants and landlords, significantly reducing search time and increasing the speed of closed deals.

Full-Scale Admin Dashboard

A professional command center that allows the client to manage all stakeholders—tenants, landlords, and brokers—while monitoring real-time activity and platform health.

05. The Takeaway: From Design to Product Leadership

Reasy demonstrated my ability to provide the strategic leadership necessary to turn a visual concept into a viable market platform. By focusing on the "why" of the matching logic and the "how" of business operations, I delivered a product that is both beautiful for the user and manageable for the owner.

Case Study 04: Oasis Hotel Management

Modernizing Hospitality Operations

01. The Problem: The High Cost of Manual Operations

Oasis Hotel relied on outdated manual processes that couldn't keep up with modern hospitality demands. This lack of a centralized system led to missed guest requests, delayed room turnovers, and a breakdown in communication between front-desk, housekeeping, and maintenance teams, ultimately impacting the guest experience and operational efficiency.

02. The Solution: A Unified Operational Ecosystem

I designed a smart, custom management system tailored specifically to the hotel's unique workflow. The platform centralizes all hotel operations into a single source of truth, enabling real-time coordination across all departments. This transformation ensures that every guest request is tracked, every room is turned over on time, and every department is perfectly aligned.

03. Project Objectives: Efficiency by Design

The goal was to move beyond simple record-keeping and create a proactive management tool.

- **Real-Time Visibility:** Provide instant insights into service needs and room statuses.
- **Interdepartmental Synergy:** Enable seamless communication between front-desk, spa, and maintenance teams.
- **Elevated Guest Experience:** Ensure a smooth, delightful journey from check-in to check-out.

04. Core Modules: The Heart of the Hotel

I focused on building intuitive tools that handle the high-pressure environment of hotel management.

The Reservations Hub

The operational core of the platform, providing real-time insights into room availability, booking sources (online, phone, agency), and check-in schedules. It features a dynamic filtering system that allows staff to manage peak-period volumes without errors.

The Alert & Service Center

A centralized system for tracking guest requests and maintenance issues. Staff can filter alerts by urgency and department, ensuring that high-priority VIP needs or maintenance emergencies are addressed immediately, with full accountability through assigned staff tracking.

05. Design Impact: Clarity Under Pressure

In a high-volume environment like the Oasis front desk, every second counts. I designed a clean, high-contrast interface that prioritizes actionable data—such as upcoming arrivals, VIP events, and staff availability. By standardizing alert cards and reservation flows, I reduced the cognitive load on staff, allowing them to focus on what matters most: providing exceptional guest service.

This portfolio project (Oasis Hotel) was produced for educational purposes to demonstrate UX/UI and system design capabilities.

Case Study 05: Smeets – Social Sports Connectivity

Building Community Through Active Motion

01. The Challenge: The Struggle for Consistent Team Sports

The idea for Smeets was born from a common personal frustration: the difficulty of maintaining a consistent sports routine without a fixed group of people. Most active individuals want to play more, but finding enough partners, coordinating schedules, and managing the logistics of team sports often becomes a barrier to staying healthy. Existing

social tools are too broad, and without a dedicated platform, most people default to playing only with close friends or, worse, not playing at all.

02. The Solution: A Community-First Sports Engine

Smeets was designed to bridge this gap by making sports connectivity as simple as a single tap. The app functions as a social sports hub that connects people with games and players nearby, removing the friction of organization. By focusing on building a "living" community rather than just a booking tool, Smeets encourages users to stay active through real-time opportunities and seamless coordination.

03. Research & Insights: Understanding the Inactive Majority

My research process revealed a significant gap in the market. Data showed that **91% of participants** don't use any app to find sports activities, even though **76% reported consistent difficulty** in finding partners. Furthermore, **67% expressed dissatisfaction** with their weekly activity levels, yet most were stuck playing only with a small circle of friends.

User interviews further refined the product direction, highlighting that for a sports app to succeed, it must prioritize **Simplicity & Speed**, offer **Gamified Motivation**, and maintain **High User Activity**. Users need to feel that the app is "alive" with constant opportunities, or they won't return.

04. Core Features: Designing for Instant Action

I focused on creating an interface that minimizes the time between "opening the app" and "joining a game."

The "One Tap" Home Screen

The home screen is strategically dedicated to the next available game. This "instant-in" approach removes decision fatigue and makes it incredibly easy for users to jump into action immediately.

Advanced Team Discovery

For those looking for something specific, I designed a robust search system with multiple filters—location, sport type, and time. Each team card is optimized to show the most critical parameters at a glance, allowing for fast, informed decisions.

In-House Coordination & Community

To ensure the app feels like a community, I integrated a **Built-in Chat** for seamless planning and "in-house" match coordination. I also designed **Group & User Profiles** that showcase participation stats and achievements. Crucially, I chose to avoid displaying skill levels to keep the environment inclusive and focused on unity rather than exclusion.

05. The Takeaway: Design as a Social Catalyst

Smeets demonstrated how a well-designed digital product can solve a physical, real-world problem. By prioritizing speed, inclusivity, and community-building features, I created a platform that doesn't just manage games—it motivates people to move. The project reinforced the importance of using research to drive every design decision, ensuring the final product truly resonates with the user's lifestyle.

This portfolio project (Smeets) was produced for educational purposes to demonstrate UX/UI and community-driven design capabilities.

Case Study 06: Axon – The Future of Smart Infrastructure

Redefining Toll Roads through AI & V2V Communication

01. The Challenge: Overcoming the Static Nature of Modern Roads

Traffic congestion is more than just an inconvenience; it's a systemic failure that results in massive time loss and elevated stress for millions of commuters. Traditional toll roads offer a faster alternative, but they remain static environments. Axon was conceived as a branding and product project to challenge this status quo, envisioning the world's first smart road that adapts to its users in real-time.

02. The Solution: An Intelligent, Autonomous Nerve System

The name "Axon" is inspired by the nerve fiber responsible for transmitting electrical signals, perfectly mirroring the road's mission to transfer vehicles from point A to point B with unprecedented speed and intelligence. Axon isn't just a route; it's an AI-powered infrastructure that utilizes real-time technologies to maintain maximum safety while significantly increasing transportation speeds.

03. Creative Process: Branding Speed and Motion

The visual identity of Axon was built to convey momentum. I reimagined the Israeli shekel symbol through a custom hexagonal grid system, tilting and sharpening the angles to create a logo that feels like it's in constant motion. This branding effort was designed to position Axon as a high-tech leader, aligning it with the futuristic aesthetics of the autonomous driving era.

04. Design Impact: A High-Tech Landing Experience

I designed a landing page that serves as a gateway to the future of transportation, balancing bold aesthetics with technical credibility.

Interactive Road Simulation

To bring the concept to life, I integrated a dynamic, interactive road simulation built with **Spline**. This allows visitors to visualize how the AI-powered infrastructure interacts with vehicles in real-time, offering a tangible glimpse into a complex technological system.

Credibility through Performance & Partnerships

The design highlights Axon's core metrics—top speed, safety records, and autonomous readiness—using a clean, modern layout. By featuring strategic partnerships with global innovators like **Tesla, OpenAI, and Mobileye**, I reinforced the brand's alignment with the cutting edge of safety and transportation technology.

Human-Centric Validation

To balance the high-tech nature of the project, I included a social layer of user validation. By integrating realistic testimonials and reviews, the design adds a sense of community and trust, proving that even the most advanced infrastructure must remain relatable and user-focused.

05. The Takeaway: Designing for a Future in Motion

Axon allowed me to explore the intersection of branding, 3D interaction, and complex infrastructure design. The project reinforced my ability to take a high-level technological concept and translate it into a compelling, human-centric brand story. It proved that in the world of smart infrastructure, design is the bridge that turns "future tech" into a trusted, everyday reality.

This portfolio project (Axon) was produced for educational purposes to demonstrate branding, 3D interaction, and futuristic UI design capabilities.
